

ABSTRACT

The invention is a portable, collapsible enclosure for protection from the elements in an outdoor environment. The tent-like enclosure is provided with one or more fabric coverings each bearing at least one color or camouflage pattern. The coverings are easily removable from the enclosure, and may be reversible, bearing one color or camouflage pattern on one side, and a different color or camouflage pattern on the reverse side. In this fashion, the same portable enclosure can be made to present a variety of appearances, depending on which covering is attached to the enclosure, and which side of the attached covering is exposed or outermost.
